

[For Candidate]

Case Study: Procurement-to-Pay (P2P) Digitalization with AI (30 mins)

Scenario

SPX operates a large logistics network with thousands of hubs, warehouses, and operational teams.

To support daily operations, multiple departments (Ops, Warehouse, Linehaul, Finance) continuously raise **purchase requests** for: Operating Asset , Vehicles (trucks, rentals), Equipment (uniforms, devices, tools), Services (maintenance, vendors)

Currently, the **Procurement-to-Pay (P2P)** process is fragmented and partially manual:

- Business teams raise requests via **emails / Google Sheets / portal** (different portals to support each flow with different purpose)
- Procurement manually: identifies vendors, compares quotations, negotiates contracts
- Contract approvals are slow and inconsistent
- Purchase Orders (PO) are created manually
- Invoice matching and payment reconciliation require heavy manual effort

Key Challenges Observed

- Difficulty in identifying the **right vendor** (existing vs new)
- Lack of **standardized pricing and contract terms**
- High **manual workload** in vendor selection, contract review, invoice matching
- Frequent **payment delays / disputes**
- Limited **cost visibility and control**
- Risk of **fraud / duplicate invoices / overpayment**

You are tasked to:

Design a **Product + AI-powered system** to:

- Digitize the end-to-end **Procurement-to-Pay workflow**
- Improve efficiency, accuracy, and cost control

- Introduce AI to automate decision-making and reduce manual effort

Questions

1. Process Understanding & Problem Framing

- Based on your understanding, draw or describe the **end-to-end Procurement-to-Pay (P2P) workflow**
(from request → vendor selection → contract → PO → invoice → payment)
- What are the key business problems and inefficiencies in this flow?
- Why are these problems critical to solve?

2. Product Solution Design (MVP)

- If given this problem, how would you design an **MVP product** to digitize the P2P flow?
- What are the **must-have features** across: Request management, Vendor management, Contract & PO, Invoice & payment
- How would you structure the **workflow and system interactions**?

3. AI & Automation Design (Core Focus)

- What **AI & Automation solutions** can be applied across the P2P lifecycle?

4. Trade-off & Stakeholder Management

- Procurement team wants **strict control & compliance**
- Business teams want **speed & flexibility**
- Finance wants **cost control & accuracy**

5. Metrics & Success Measurement

- What KPIs would you use to evaluate success?

Candidate Instruction

Format: any kinds of tool that can show your ideas

Please answer concisely and focus on the main points.

Presentation Time: 15 minutes

Q&A Time: 15 minutes
